

You can help stop COVID-19 by enabling exposure notifications on your smartphone.

How does it work?

Apple and Google worked together to create a way to anonymously perform COVID-19 contact tracing using your smartphone. This system exchanges random identification numbers with nearby smartphones using Bluetooth. If someone receives a positive COVID-19 diagnosis they can anonymously report that diagnosis through the phone and anyone who has been within close range of that person within the past 14 days will receive a notification on their phone that they may have been exposed to coronavirus and should get tested and/or quarantine.

How can I participate?

Using your smartphone scan this QR code for information on how to enable contact tracing.
